                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superractivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is mature human HER-2 membrane distal extracellular domain.

This sequence is used in the HER500 and HER300 GM-CSF fusion constructs

                                                                                                                                                                                                                                                                    The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER300 rGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, an ovalbumin (OVA)-derived immunodominant octapeptide, an Ala linker, a HER-2 membrane distal extracellular domain, a mature and linker, a HER-2 membrane distal intracellular domain, a mature to the protein construct which comprises human PAP signal sequence, mature HER-2 membrane distal extracellular domain, a mature and linker, a HER-2 membrane distal intracellular domain, a mature to construct which construct of the protein construct which construct domain, a mature to construct which construct which construct domain, a mature to construct which construct domain, a mature to construct which construct which construct domain, a mature to construct which construct which construct domain, and the construct which construct domain which construct wh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acid molecules encoding such proteins. The IFPS comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER-2 membrane distal extracellular and intracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of ∄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to immunostimulatory fusion proteins (IFP)

immunostimulatory fusion protein comprising the intracellular domain HER-2 and an antigen elicits an immune response to the antigen and useful for the treatment of associated cancer associated -

Page English.

The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion protein construct which comprises human PAP signal sequence, mature HER-2 membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, HER-2 membrane distal intracellular domain and a C-terminal tag.

                                                                                                                                                                                                                        CC The invention relates to a method for treating cancer in a human patient, CC wherein the cancer expresses epidermal growth factor receptor (EGFR), CC comprising administering an antibody which binds ErbB2 (HER2: AAB60408). CC In particular, the anti-ErbB2 antibody is the murine monoclonal antibody. CC 2c4 (AAB60396, AAB60397) or a humanised version of 2c4 (AAB60398, CC AAB60399). The invention also encompasses an isolated nucleic acid CC encoding a humanised ErbB2-binding antibody: a the recombinant production of a humanised CC comprising such nucleic acids; the recombinant production of a humanised CC erbB2-binding antibody; and an immunoconjugate comprising a humanised CC erbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC erbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC erbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC erbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC erbB2-binding antibody and a cytotoxic drug. The ErbB2-binding antibodies CC ext by antagonising ErbB receptors, and as inhibitors of transforming CC growth factor alpha (TGF-alpha)-activated mitogen activated protein CC especially colon cancer, rectal cancer, colorectal cancer, lung cancer, CC especially colon cancer, rectal cancer, colorectal cancer (especially colon cancer). The antibodies may also have non-therapeutic CC uses e.g., as affinity purification agents. Using an antibody which binds CC to ErbB2 as a cancer to active drug will also bind, with skin toxicity. The antibodies are anticipated to have a better safety profile than such drugs.

                      cell growth, differentiation and survival. The receptor family includes four distinct members including Epidermal Growth Factor Receptor (EGFR (ErbB1), HER2 (ErbB2 or p185^neu), HER3 (ErbB3) and Her4 (ErbB4 or tyro2). The present invention relates to a method for treating prostate cancer. The method comprises administering an antibody which binds ErbB2 and blocks ligand activation of an ErbB receptor. Preferably, the antibody blocks binding of monoclonal antibody 2C4 to ErbB2 and/or blocks Diggresiant activation of mitogen-activated protein kinase (MAPK). The present sequence is the extracellular domain of human ErbB2.
                                                                                                                                                                                        Treating prostate cancer in a human which binds ErbB2 and blocks ligand

                                                                                                                                                                                               The present sequence is the extracellular HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (CORI-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                      The present sequence is that of the extracellular domain of human Her-2/neu (p185 glycoprotein or c-erb82), an oncogenic self-protein and target for anti-cancer vaccines. The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu (see AMS1143) is a member of the tyrosine kinase family of receptor-like glycoproteins. It comprises an extracellular domain with homology to the epidermal growth factor receptor (EGFR), a highly hydrophobic transmembrane domain and a C-terminal intracellular domain that also shows homology to EGFR. Its overexpression correlates with a poor prognosis in breast and overexpression correlates with a poor prognosis in breast and
ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of a Her-2/neu protein is fused to a Her-2/neu intracellular domain or

An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells to the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in order to inhibit the development of cancer in a patient.

The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 hGM-CSF fusion protein construct which comprises human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature PAP protein, an Ala Arg linker, human granulocytersingual sequence, mature PAP and ala linker, a mature human granulocyter macrophage colony stimulating factor (GM-CSF) sequence and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC) induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 TCM-CSF fusion protein construct which comprises human PAP signal sequence, mature HER-2 membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, HER-2 membrane distal intracellular domain, an Ala Ala linker, a mature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of

HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. HER-2/neu fusion proteins may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. They may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against these neoplasias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 27; Fig 13; 128pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a fusion protein between the extracellular domain and a fragment (DeltaPD) of the phosphorylation domain of human Her-2/neu (see AAM51143), an oncogenic self-protein and target for anti-cancer vaccines. The fusion protein can be obtained by recombinant DNA methods. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding the fusion protein, and delivering the transfected cells to the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in order to inhibit the development of cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of Her-2/neu is fused to a Her-2/neu intracellular domain or phosphorylation domain (or its DeltaPD intracellular domain or phosphorylation domain or phosphorylation domain (or its DeltaPD intracellular domain or phosphorylation domain or phosphorylation domain (or its DeltaPD intracellular domain or phosphorylation domain or phosphorylation domain (or its DeltaPD intracellular domain or phosphorylation domain domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim

                                                                                                                                                                       that is overexpressed in breast, ovarian can other cancer cells) and granulocyte-macrophage colony stimulating factor (GM-CSF). It is the expression product of a nucleic acid molecule (AAT72725) prepd. by PCR amplification of Her2 cDNA from a breast cancer cell line and fusion to GM-CSF cDNA. Fusion expression vectors can be used to transfect mammalian and insect cells. The Her2-GM-CSF fusion protein is used to generate anti-Her2 immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo
                                                                         Sequence
                                                                                                                                                  cells are eliminated by cytotoxic T lymphocytor in vitro by exposure to antigen-presenting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                         The present sequence is a fusion protein comprising the extracellular domain and the phosphorylation domain of the human HER-Z/neu protein. HER-Z/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-Z/neu gene is an oncogene. HER-Z/neu fusion proteins may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-Z/neu protein. They may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an extract the content protein that the prostate cancers.

response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells to the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in order to inhibit the development of cancer in a patient. Sequence vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of a Her-Z/neu protein is fused to a Her-Z/neu intracellular domain or phosphorylation domain (or its DeltaPD fragment). An immune methods. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and 919 AA;

RESULT 6
GOHUE

epidermal growth factor receptor precursor - human
N;Conttains: protein-tyrosine kinase (EC 2.7.1.112) erbB
C;Species: Homo sapiens (man)
C;Date: 15-Nov-1984 #sequence_revision 27-Nov-1985 #text_change 11-Jun-1999.
C;Accession: A00641; A25772; S30024; A38672; A00642; A43615; A23062; A05281; A60143;
C;Accession: A00641; A25772; S30024; A38672; A00642; A43615; A23062; A05281; A60143;
C;Accession: A00641; A25, 1984
A;Title: Human epidermal growth factor receptor cDNA sequence and aberrant expression
A;Reference number: A00641; MUID:84219729; PMID:6328312
A;Accession: A00641
A;Residues: 1-1210 <UILL>
A;Cross-references: EMBL:X00588; NID:g31113; PIDN:CAA25240.1; PID:g757924
A;Note: the authors translated the codon AAG for residue 540 as Asn
